

Oracle® Database

SQL Language Quick Reference

11g Release 1 (11.1)

B28285-03

August 2008

The Programs (which include both the software and documentation) contain proprietary information; they are provided under a license agreement containing restrictions on use and disclosure and are also protected by copyright, patent, and other intellectual and industrial property laws. Reverse engineering, disassembly, or decompilation of the Programs, except to the extent required to obtain interoperability with other independently created software or as specified by law, is prohibited.

The information contained in this document is subject to change without notice. If you find any problems in the documentation, please report them to us in writing. This document is not warranted to be error-free. Except as may be expressly permitted in your license agreement for these Programs, no part of these Programs may be reproduced or transmitted in any form or by any means, electronic or mechanical, for any purpose.

If the Programs are delivered to the United States Government or anyone licensing or using the Programs on behalf of the United States Government, the following notice is applicable:

U.S. GOVERNMENT RIGHTS Programs, software, databases, and related documentation and technical data delivered to U.S. Government customers are "commercial computer software" or "commercial technical data" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the Programs, including documentation and technical data, shall be subject to the licensing restrictions set forth in the applicable Oracle license agreement, and, to the extent applicable, the additional rights set forth in FAR 52.227-19, Commercial Computer Software--Restricted Rights (June 1987). Oracle USA, Inc., 500 Oracle Parkway, Redwood City, CA 94065.

The Programs are not intended for use in any nuclear, aviation, mass transit, medical, or other inherently dangerous applications. It shall be the licensee's responsibility to take all appropriate fail-safe, backup, redundancy and other measures to ensure the safe use of such applications if the Programs are used for such purposes, and we disclaim liability for any damages caused by such use of the Programs.

Oracle, JD Edwards, PeopleSoft, and Siebel are registered trademarks of Oracle Corporation and/or its affiliates. Other names may be trademarks of their respective owners.

The Programs may provide links to Web sites and access to content, products, and services from third parties. Oracle is not responsible for the availability of, or any content provided on, third-party Web sites. You bear all risks associated with the use of such content. If you choose to purchase any products or services from a third party, the relationship is directly between you and the third party. Oracle is not responsible for: (a) the quality of third-party products or services; or (b) fulfilling any of the terms of the agreement with the third party, including delivery of products or services and warranty obligations related to purchased products or services. Oracle is not responsible for any loss or damage of any sort that you may incur from dealing with any third party.

-------------------------	-----

Index

Preface

This quick reference contains a high-level description of the Structured Query Language (SQL) used to manage information in an Oracle database. Oracle SQL is a superset of the American National Standards Institute (ANSI) and the International Standards Organization (ISO) standard.

This Preface contains these topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Related Documents](#)
- [Conventions](#)

Audience

SQL Language Quick Reference is intended for all users of Oracle SQL.

Documentation Accessibility

Our goal is to make Oracle products, services, and supporting documentation accessible, with good usability, to the disabled community. To that end, our documentation includes features that make information available to users of assistive technology. This documentation is available in HTML format, and contains markup to facilitate access by the disabled community. Accessibility standards will continue to evolve over time, and Oracle is actively engaged with other market-leading technology vendors to address technical obstacles so that our documentation can be accessible to all of our customers. For more information, visit the Oracle Accessibility Program Web site at

<http://www.oracle.com/accessibility/>

Accessibility of Code Examples in Documentation

Screen readers may not always correctly read the code examples in this document. The conventions for writing code require that closing braces should appear on an otherwise empty line; however, some screen readers may not always read a line of text that consists solely of a bracket or brace.

Accessibility of Links to External Web Sites in Documentation

This documentation may contain links to Web sites of other companies or organizations that Oracle does not own or control. Oracle neither evaluates nor makes any representations regarding the accessibility of these Web sites.

TTY Access to Oracle Support Services

Oracle provides dedicated Text Telephone (TTY) access to Oracle Support Services within the United States of America 24 hours a day, 7 days a week. For TTY support, call 800.446.2398. Outside the United States, call +1.407.458.2479.

Related Documents

For more information, see these Oracle resources:

- *Oracle Database SQL Language Reference*

- *SQL*Plus User's Guide and Reference*

Conventions

The following text conventions are used in this document:

Convention	Meaning
boldface	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for which you supply particular values.
<code>monospace</code>	Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

SQL Statements

This chapter presents the syntax for Oracle SQL statements.

This chapter includes the following section:

- [Syntax for SQL Statements](#)

Syntax for SQL Statements

SQL statements are the means by which programs and users access data in an Oracle database.

The sections that follow show each SQL statement and its related syntax. Refer to [Chapter 5, "Subclauses"](#) for the syntax of the subclauses listed in the syntax for the statements.

See Also: *Oracle Database SQL Language Reference* for detailed information about Oracle SQL

ALTER CLUSTER

```
ALTER CLUSTER [ schema. ]cluster
  { physical_attributes_clause
  | SIZE size_clause
  | allocate_extent_clause
  | deallocate_unused_clause
  | { CACHE | NOCACHE }
  | ...
  [ parallel_clause ] ;
```

ALTER DATABASE

```
ALTER DATABASE [ database ]
  { startup_clauses
  | recovery_clauses
  | database_file_clauses
  | logfile_clauses
  | controlfile_clauses
  | standby_database_clauses
  | default_settings_clauses
  | instance_clauses
  | security_clause
  } ;
```

ALTER DIMENSION

```
ALTER DIMENSION [ schema. ] dimension
  { ADD { level_clause
        | hierarchy_clause
        | attribute_clause
```

```
        | extended_attribute_clause
      }
    } ...
    |
    { DROP { LEVEL level [ RESTRICT | CASCADE ]
            | HIERARCHY hierarchy
            | ATTRIBUTE attribute [ LEVEL level [ COLUMN column ] ]...
          }
    } ...
    |
    COMPILE
  ;
```

ALTER DISKGROUP

```
ALTER DISKGROUP
  { { diskgroup_name
    { { add_disk_clause | drop_disk_clause }
      [, { add_disk_clause | drop_disk_clause } ]...
    | resize_disk_clauses
    } [ rebalance_diskgroup_clause ]
    | { disk_online_clause
      | disk_offline_clause
      | rebalance_diskgroup_clause
        | check_diskgroup_clause
        | diskgroup_template_clauses
        | diskgroup_directory_clauses
        | diskgroup_alias_clauses
      | diskgroup_attributes
        | drop_diskgroup_file_clause
      }
    | { diskgroup_name [, diskgroup_name ] ...
      | ALL
    } { undrop_disk_clause
      | diskgroup_availability
    }
  }
```

ALTER FLASHBACK ARCHIVE

```
ALTER FLASHBACK ARCHIVE flashback_archive
  { SET DEFAULT
  | { ADD | MODIFY } TABLESPACE tablespace [flashback_archive_quota]
  | REMOVE TABLESPACE tablespace_name
  | MODIFY RETENTION flashback_archive_retention
  | PURGE { ALL
          | BEFORE { SCN expr | TIMESTAMP expr}
        }
  };
```

ALTER FUNCTION

```
ALTER FUNCTION [ schema. ] function function_compile_clause;
```

ALTER INDEX

```
ALTER INDEX [ schema. ] index
  { { deallocate_unused_clause
    | allocate_extent_clause
    | shrink_clause
    | parallel_clause
    | physical_attributes_clause
    | logging_clause
  } ...
  | rebuild_clause
  | PARAMETERS ( 'ODCI_parameters' )
```

```

        )

SQL Functions

This chapter presents the syntax for SQL functions.

This chapter includes the following section:

- [Syntax for SQL Functions](#)

Syntax for SQL Functions

A function is a command that manipulates data items and returns a single value.

The sections that follow show each SQL function and its related syntax. Refer to [Chapter 5, "Subclauses"](#) for the syntax of the subclauses.

See Also: Functions in *Oracle Database SQL Language Reference* for detailed information about SQL functions

              )
```

SQL Expressions

This chapter presents the syntax for combining values, operators, and functions into expressions.

This chapter includes the following section:

- [Syntax for SQL Expression Types](#)

Syntax for SQL Expression Types

An expression is a combination of one or more values, operators, and SQL functions that evaluate to a value. An expression generally assumes the datatype of its components.

Expressions have several forms. The sections that follow show the syntax for each form of expression. Refer to [Chapter 5, "Subclauses"](#) for the syntax of the subclauses.

See Also: Expressions in *Oracle Database SQL Language Reference* for detailed information about SQL expressions

CASE expression

```
CASE { simple_case_expression
      | searched_case_expression
      }
      [ else_clause ]
END
```

Compound expression

```
{ (expr)
  | { + | - | PRIOR } expr
  | expr { * | / | + | - | || } expr
}
```

Note: The double vertical bars are part of the syntax (indicating concatenation) rather than BNF notation.

CURSOR expression

```
CURSOR (subquery)
```

DATETIME expression

```
expr AT
{ LOCAL
  | TIME ZONE { ' [ + | - ] hh:mm'
               | DBTIMEZONE
               | 'time_zone_name'
               | expr
               }
}
```

```
}
```

Function expression

any built-in SQL function or user-defined function can be used as an expression

INTERVAL expression

```
expr
{ DAY [ (leading_field_precision) ] TO
  SECOND [ (fractional_second_precision) ]
| YEAR [ (leading_field_precision) ] TO
  MONTH
}
```

Model expression

```
{ measure_column [ { condition | expr } [ , { condition | expr } ... ] ]
| aggregate_function
  { [ { condition | expr } [ , { condition | expr } ... ] ]
  | [ single_column_for_loop [ , single_column_for_loop ] ... ]
  | [ multi_column_for_loop ]
  }
| analytic_function
}
```

Note: The outside square brackets shown in boldface type are part of the syntax. In this case, they do not represent optionality.

Object access expression

```
{ table_alias.column.
| object_table_alias.
| (expr).
}
{ attribute [.attribute ]...
  [.method ([ argument [, argument ]... ]) ]
| method ([ argument [, argument ]... ])
}
```

Placeholder expression

```
:host_variable
[ [ INDICATOR ]
  :indicator_variable
]
```

Scalar subquery expression

a subquery that returns exactly one column value from one row can be used as an expression

Simple expression

```
{ [ query_name.
  [ [schema.]
    { table. | view. | materialized view. }
  ] { column | ROWID }
| ROWNUM
| string
| number
| sequence. { CURRVAL | NEXTVAL }
| NULL
}
```

Type constructor expression

```
[ NEW ] [ schema. ]type_name  
  ([ expr [, expr ]... ])
```

SQL Conditions

This chapter presents the syntax for combining one or more expressions and logical (Boolean) operators to specify a condition.

This chapter includes the following section:

- [Syntax for SQL Condition Types](#)

Syntax for SQL Condition Types

A condition specifies a combination of one or more expressions and logical (Boolean) operators and returns a value of TRUE, FALSE, or unknown.

Conditions have several forms. The sections that follow show the syntax for each form of condition. Refer to [Chapter 5, "Subclauses"](#) for the syntax of the subclauses.

See Also: Conditions in *Oracle Database SQL Language Reference* for detailed information about SQL conditions

Compound conditions

```
{ (condition)
| NOT condition
| condition { AND | OR } condition
}
```

EQUALS_PATH condition

```
EQUALS_PATH
(column, path_string [, correlation_integer ])
```

EXISTS condition

```
EXISTS (subquery)
```

Floating-point conditions

```
expr IS [ NOT ] { NAN | INFINITE }
```

Group comparison condition

```
{ expr
  { = | != | ^= | <> | > | < | >= | <= }
  { ANY | SOME | ALL }
  ({ expression_list | subquery })
| expr
  [, expr ]...
  { = | != | ^= | <> }
  { ANY | SOME | ALL }
  ({ expression_list
```

```
        [, expression_list ]...
    | subquery
    }
    )
}
```

where !=, ^=, and <> test for inequality

IN conditions

```
{ expr [ NOT ] IN ({ expression_list | subquery })
| ( expr [, expr ]... )
  [ NOT ] IN ({ expression_list [, expression_list ]...
              | subquery
              }
            )
}
```

IS A SET conditions

```
nested_table IS [ NOT ] A SET
```

IS ANY condition

```
[ dimension_column IS ] ANY
```

IS EMPTY conditions

```
nested_table IS [ NOT ] EMPTY
```

IS OF TYPE conditions

```
expr IS [ NOT ] OF [ TYPE ]
    ([ ONLY ] [ schema. ] type
    [, [ ONLY ] [ schema. ] type ]...
    )
```

IS PRESENT condition

```
cell_reference IS PRESENT
```

LIKE condition

```
char1 [ NOT ] { LIKE | LIKEC | LIKE2 | LIKE4 }
char2 [ ESCAPE esc_char ]
```

Logical conditions

```
{ NOT | AND | OR }
```

MEMBER condition

```
expr [ NOT ] MEMBER [ OF ] nested_table
```

NULL conditions

```
expr IS [ NOT ] NULL
```

REGEXP_LIKE condition

```
REGEXP_LIKE(source_char, pattern
            [, match_param ]
            )
```

Simple comparison condition

```
{ expr
```

```
{ = | != | ^= | <> | > | < | >= | <= }  
expr  
| (expr [, expr ]...)  
{ = | != | ^= | <> }  
(subquery)  
}  
where !=, ^=, and <> test for inequality
```

SUBMULTISET conditions

```
nested_table1  
[ NOT ] SUBMULTISET [ OF ]  
nested_table2
```

UNDER_PATH condition

```
UNDER_PATH (column [, levels ], path_string  
            [, correlation_integer ]  
            )
```

Subclauses

This chapter presents the syntax for the subclauses found in the syntax for SQL statements, functions, expressions and conditions.

This chapter includes the following section:

- [Syntax for Subclauses](#)

Syntax for Subclauses

The sections that follow show the syntax for each subclause found in:

- [Chapter 1, "SQL Statements"](#)
- [Chapter 2, "SQL Functions"](#)
- [Chapter 3, "SQL Expressions"](#)
- [Chapter 4, "SQL Conditions"](#)

Datatypes

This chapter presents datatypes that are recognized by Oracle and available for use within SQL.

This chapter includes the following sections:

- [Overview of Datatypes](#)
- [Oracle Built-In Datatypes](#)
- [Converting to Oracle Datatypes](#)

Overview of Datatypes

A **datatype** is a classification of a particular type of information or data. Each value manipulated by Oracle has a datatype. The datatype of a value associates a fixed set of properties with the value. These properties cause Oracle to treat values of one datatype differently from values of another.

The datatypes recognized by Oracle are:

ANSI-supported datatypes

```
{ CHARACTER [VARYING] (size)
| { CHAR | NCHAR } VARYING (size)
| VARCHAR (size)
| NATIONAL { CHARACTER | CHAR }
  [VARYING] (size)
| { NUMERIC | DECIMAL | DEC }
  [ (precision [, scale ]) ]
| { INTEGER | INT | SMALLINT }
| FLOAT [ (size) ]
| DOUBLE PRECISION
| REAL
}
```

Oracle built-in datatypes

```
{ character_datatypes
| number_datatypes
| long_and_raw_datatypes
| datetime_datatypes
| large_object_datatypes
| rowid_datatypes
}
```

Oracle-supplied datatypes

```
{ any_types
| XML_types
}
```

```
| spatial_types  
| media_types  
| expression_filter_type  
}
```

User-defined datatypes

User-defined datatypes use Oracle built-in datatypes and other user-defined datatypes to model the structure and behavior of data in applications

See Also: Datatypes in *Oracle Database SQL Language Reference*

Oracle Built-In Datatypes

This section describes the kinds of Oracle built-in datatypes.

character_datatypes

```
{ CHAR [ (size [ BYTE | CHAR ]) ]  
| VARCHAR2 (size [ BYTE | CHAR ]) ]  
| NCHAR [ (size) ]  
| NVARCHAR2 (size)  
}
```

datetime_datatypes

```
{ DATE  
| TIMESTAMP [ (fractional_seconds_precision) ]  
  [ WITH [ LOCAL ] TIME ZONE ] )  
| INTERVAL YEAR [ (year_precision) ] TO MONTH  
| INTERVAL DAY [ (day_precision) ] TO SECOND  
  [ (fractional_seconds_precision) ]  
}
```

large_object_datatypes

```
{ BLOB | CLOB | NCLOB | BFILE }
```

long_and_raw_datatypes

```
{ LONG | LONG RAW | RAW (size) }
```

number_datatypes

```
{ NUMBER [ (precision [, scale ]) ]  
| FLOAT [ (precision) ]  
| BINARY_FLOAT  
| BINARY_DOUBLE  
}
```

rowid_datatypes

```
{ ROWID | UROWID [ (size) ] }
```

The codes listed for the datatypes are used internally by Oracle Database. The datatype code of a column or object attribute is returned by the DUMP function.

Table 6–1 Built-in Datatype Summary

Code	Datatype	Description
1	VARCHAR2(<i>size</i> [BYTE CHAR])	Variable-length character string having maximum length <i>size</i> bytes or characters. Maximum <i>size</i> is 4000 bytes or characters, and minimum is 1 byte or 1 character. You must specify <i>size</i> for VARCHAR2. BYTE indicates that the column will have byte length semantics; CHAR indicates that the column will have character semantics.
1	NVARCHAR2(<i>size</i>)	Variable-length Unicode character string having maximum length <i>size</i> characters. The number of bytes can be up to two times <i>size</i> for AL16UTF16 encoding and three times <i>size</i> for UTF8 encoding. Maximum <i>size</i> is determined by the national character set definition, with an upper limit of 4000 bytes. You must specify <i>size</i> for NVARCHAR2.
2	NUMBER [(<i>p</i> , <i>s</i>)]	Number having precision <i>p</i> and scale <i>s</i> . The precision <i>p</i> can range from 1 to 38. The scale <i>s</i> can range from -84 to 127. Both precision and scale are in decimal digits. A NUMBER values requires from 1 to 22 bytes.
2	FLOAT [(<i>p</i>)]	A subtype of the NUMBER datatype having precision <i>p</i> . A FLOAT value is represented internally as NUMBER. The precision <i>p</i> can range from 1 to 126 binary digits. A FLOAT value requires from 1 to 22 bytes.
8	LONG	Character data of variable length up to 2 gigabytes, or 2 ³¹ -1 bytes. Provided for backward compatibility.
12	DATE	Valid date range from January 1, 4712 BC to December 31, 9999 AD. The default format is determined explicitly by the NLS_DATE_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is fixed at 7 bytes. This datatype contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, and SECOND. It does not have fractional seconds or a time zone.
21	BINARY_FLOAT	32-bit floating point number. This datatype requires 5 bytes, including the length byte.
22	BINARY_DOUBLE	64-bit floating point number. This datatype requires 9 bytes, including the length byte.
180	TIMESTAMP [(<i>fractional_seconds_precision</i>)]	Year, month, and day values of date, as well as hour, minute, and second values of time, where <i>fractional_seconds_precision</i> is the number of digits in the fractional part of the SECOND datetime field. Accepted values of <i>fractional_seconds_precision</i> are 0 to 9. The default is 6. The default format is determined explicitly by the NLS_DATE_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The sizes varies from 7 to 11 bytes, depending on the precision. This datatype contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, and SECOND. It contains fractional seconds but does not have a time zone.
181	TIMESTAMP [(<i>fractional_seconds</i>)] WITH TIME ZONE	All values of TIMESTAMP as well as time zone displacement value, where <i>fractional_seconds_precision</i> is the number of digits in the fractional part of the SECOND datetime field. Accepted values are 0 to 9. The default is 6. The default format is determined explicitly by the NLS_DATE_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The size is fixed at 13 bytes. This datatype contains the datetime fields YEAR, MONTH, DAY, HOUR, MINUTE, SECOND, TIMEZONE_HOUR, and TIMEZONE_MINUTE. It has fractional seconds and an explicit time zone.

Table 6–1 (Cont.) Built-in Datatype Summary

Code	Datatype	Description
231	TIMESTAMP [(<i>fractional_seconds</i>)] WITH LOCAL TIME ZONE	All values of TIMESTAMP WITH TIME ZONE, with the following exceptions: - Data is normalized to the database time zone when it is stored in the database. - When the data is retrieved, users see the data in the session time zone. The default format is determined explicitly by the NLS_DATE_FORMAT parameter or implicitly by the NLS_TERRITORY parameter. The sizes varies from 7 to 11 bytes, depending on the precision.
182	INTERVAL YEAR [(<i>year_precision</i>)] TO MONTH	Stores a period of time in years and months, where <i>year_precision</i> is the number of digits in the YEAR datetime field. Accepted values are 0 to 9. The default is 2. The size is fixed at 5 bytes.
183	INTERVAL DAY [(<i>day_precision</i>)] TO SECOND [(<i>fractional_seconds</i>)]	Stores a period of time in days, hours, minutes, and seconds, where <i>day_precision</i> is the maximum number of digits in the DAY datetime field. Accepted values are 0 to 9. The default is 2. <i>fractional_seconds_precision</i> is the number of digits in the fractional part of the SECOND field. Accepted values are 0 to 9. The default is 6. The size is fixed at 11 bytes.
23	RAW(<i>size</i>)	Raw binary data of length <i>size</i> bytes. Maximum <i>size</i> is 2000 bytes. You must specify <i>size</i> for a RAW value.
24	LONG RAW	Raw binary data of variable length up to 2 gigabytes.
69	ROWID	Base 64 string representing the unique address of a row in its table. This datatype is primarily for values returned by the ROWID pseudocolumn.
208	UROWID [(<i>size</i>)]	Base 64 string representing the logical address of a row of an index-organized table. The optional <i>size</i> is the size of a column of type UROWID. The maximum size and default is 4000 bytes.
96	CHAR [(<i>size</i> [BYTE CHAR])]	Fixed-length character data of length <i>size</i> bytes or characters. Maximum <i>size</i> is 2000 bytes or characters. Default and minimum <i>size</i> is 1 byte. BYTE and CHAR have the same semantics as for VARCHAR2.
96	NCHAR[(<i>size</i>)]	Fixed-length character data of length <i>size</i> characters. The number of bytes can be up to two times <i>size</i> for AL16UTF16 encoding and three times <i>size</i> for UTF8 encoding. Maximum <i>size</i> is determined by the national character set definition, with an upper limit of 2000 bytes. Default and minimum <i>size</i> is 1 character.
112	CLOB	A character large object containing single-byte or multibyte characters. Both fixed-width and variable-width character sets are supported, both using the database character set. Maximum size is (4 gigabytes - 1) * (database block size).

Table 6–1 (Cont.) Built-in Datatype Summary

Code	Datatype	Description
112	NCLOB	A character large object containing Unicode characters. Both fixed-width and variable-width character sets are supported, both using the database national character set. Maximum size is (4 gigabytes - 1) * (database block size). Stores national character set data.
113	BLOB	A binary large object. Maximum size is (4 gigabytes - 1) * (database block size).
114	BFILE	Contains a locator to a large binary file stored outside the database. Enables byte stream I/O access to external LOBs residing on the database server. Maximum size is 4 gigabytes.

Oracle Supplied Datatypes

This section shows the syntax for the Oracle supplied datatypes.

any_types

```
{ SYS.AnyData | SYS.AnyType | SYS.AnyDataSet }
```

XML_types

```
{ XMLType | URIType }
```

spatial_types

```
{ SDO_Geometry | SDO_Topo_Geometry | SDO_GeoRaster }
```

media_types

```
{ ORDAudio
| ORDImage
| ORDVideo
| ORDDoc
| ORDDicom
| still_image_object_types
}
```

expression_filter_type

```
Expression
```

Converting to Oracle Datatypes

SQL statements that create tables and clusters can also use ANSI datatypes and datatypes from the IBM products SQL/DS and DB2. Oracle recognizes the ANSI or IBM datatype name that differs from the Oracle datatype name, records it as the name of the datatype of the column, and then stores the column data in an Oracle datatype based on the conversions shown in the following table.

Table 6–2 ANSI Datatypes Converted to Oracle Datatypes

ANSI SQL Datatype	Oracle Datatype
CHARACTER (n)	CHAR (n)
CHAR (n)	
CHARACTER VARYING (n)	VARCHAR2 (n)
CHAR VARYING (n)	
NATIONAL CHARACTER (n)	NCHAR (n)
NATIONAL CHAR (n)	
NCHAR (n)	
NATIONAL CHARACTER VARYING (n)	NVARCHAR2 (n)
NATIONAL CHAR VARYING (n)	
NCHAR VARYING (n)	
NUMERIC [(p, s)]	NUMBER (p, s)
DECIMAL [(p, s)] (Note a)	
INTEGER	NUMBER (38)
INT	
SMALLINT	
FLOAT (Note b)	FLOAT (126)
DOUBLE PRECISION (Note c)	FLOAT (126)
REAL (Note d)	FLOAT (63)

Notes:

- a. The NUMERIC and DECIMAL datatypes can specify only fixed-point numbers. For those datatypes, the scale (s) defaults to 0.
- b. The FLOAT datatype is a floating-point number with a binary precision b. The default precision for this datatype is 126 binary, or 38 decimal.
- c. The DOUBLE PRECISION datatype is a floating-point number with binary precision 126.
- d. The REAL datatype is a floating-point number with a binary precision of 63, or 18 decimal.

Table 6–3 SQL/DS and DB2 Datatypes Converted to Oracle Datatypes

SQL/DS or DB2 Datatype	Oracle Datatype
CHARACTER (n)	CHAR (n)
VARCHAR (n)	VARCHAR (n)
LONG VARCHAR	LONG
DECIMAL (p, s) (a)	NUMBER (p, s)
INTEGER	NUMBER (38)
SMALLINT	
FLOAT (b)	NUMBER

Notes:

- a. The `DECIMAL` datatype can specify only fixed-point numbers. For this datatype, *s* defaults to 0.
- b. The `FLOAT` datatype is a floating-point number with a binary precision *b*. The default precision for this datatype is 126 binary or 38 decimal.

Do not define columns with the following SQL/DS and DB2 datatypes, because they have no corresponding Oracle datatype:

- `GRAPHIC`
- `LONG VARGRAPHIC`
- `VARGRAPHIC`
- `TIME`

Note that data of type `TIME` can also be expressed as Oracle datetime data.

See Also: Datatypes in *Oracle Database SQL Language Reference*

Format Models

This chapter presents the format models for datetime and number data stored in character strings.

This chapter includes the following sections:

- [Overview of Format Models](#)
- [Number Format Models](#)
- [Datetime Format Models](#)

Overview of Format Models

A format model is a character literal that describes the format of `DATETIME` or `NUMBER` data stored in a character string. When you convert a character string into a datetime or number, a format model tells Oracle how to interpret the string.

See Also: Format Models in *Oracle Database SQL Language Reference*

Number Format Models

You can use number format models:

- In the `TO_CHAR` function to translate a value of `NUMBER` datatype to `VARCHAR2` datatype
- In the `TO_NUMBER` function to translate a value of `CHAR` or `VARCHAR2` datatype to `NUMBER` datatype

Number Format Elements

A number format model is composed of one or more number format elements. The following table lists the elements of a number format model.

Table 7-1 Number Format Elements

Element	Example	Description
, (comma)	9,999	Returns a comma in the specified position. You can specify multiple commas in a number format model. Restrictions: ■ A comma element cannot begin a number format model. ■ A comma cannot appear to the right of a decimal character or period in a number format model.
. (period)	99.99	Returns a decimal point, which is a period (.) in the specified position. Restriction: You can specify only one period in a number format model.
\$	\$9999	Returns value with a leading dollar sign.
0	0999 9990	Returns leading zeros. Returns trailing zeros.
9	9999	Returns value with the specified number of digits with a leading space if positive or with a leading minus if negative. Leading zeros are blank, except for a zero value, which returns a zero for the integer part of the fixed-point number.
B	B9999	Returns blanks for the integer part of a fixed-point number when the integer part is zero (regardless of zeros in the format model).
C	C999	Returns in the specified position the ISO currency symbol (the current value of the NLS_ISO_CURRENCY parameter).
D	99D99	Returns in the specified position the decimal character, which is the current value of the NLS_NUMERIC_CHARACTER parameter. The default is a period (.). Restriction: You can specify only one decimal character in a number format model.
EEEE	9.9EEEE	Returns a value using in scientific notation.
G	9G999	Returns in the specified position the group separator (the current value of the NLS_NUMERIC_CHARACTER parameter). You can specify multiple group separators in a number format model. Restriction: A group separator cannot appear to the right of a decimal character or period in a number format model.
L	L999	Returns in the specified position the local currency symbol (the current value of the NLS_CURRENCY parameter).
MI	9999MI	Returns negative value with a trailing minus sign (-). Returns positive value with a trailing blank. Restriction: The MI format element can appear only in the last position of a number format model.
PR	9999PR	Returns negative value in <angle brackets>. Returns positive value with a leading and trailing blank. Restriction: The PR format element can appear only in the last position of a number format model.
RN	RN	Returns a value as Roman numerals in uppercase.
rn	rn	Returns a value as Roman numerals in lowercase. Value can be an integer between 1 and 3999.

Table 7–1 (Cont.) Number Format Elements

Element	Example	Description
S	S9999 9999S	Returns negative value with a leading minus sign (-). Returns positive value with a leading plus sign (+). Returns negative value with a trailing minus sign (-). Returns positive value with a trailing plus sign (+). Restriction: The S format element can appear only in the first or last position of a number format model.
TM	TM	The text minimum number format model returns (in decimal output) the smallest number of characters possible. This element is case insensitive. The default is TM9, which returns the number in fixed notation unless the output exceeds 64 characters. If the output exceeds 64 characters, then Oracle Database automatically returns the number in scientific notation. Restrictions: - You cannot precede this element with any other element. - You can follow this element only with one 9 or one E (or e), but not with any combination of these. The following statement returns an error: <pre>SELECT TO_CHAR(1234, 'TM9e') FROM DUAL;</pre>
U	U9999	Returns in the specified position the Euro (or other) dual currency symbol (the current value of the NLS_DUAL_CURRENCY parameter).
V	999V99	Returns a value multiplied by 10 ⁿ (and if necessary, round it up), where <i>n</i> is the number of 9's after the V.
X	XXXX xxxxx	Returns the hexadecimal value of the specified number of digits. If the specified number is not an integer, then Oracle Database rounds it to an integer. Restrictions: - This element accepts only positive values or 0. Negative values return an error. - You can precede this element only with 0 (which returns leading zeroes) or FM. Any other elements return an error. If you specify neither 0 nor FM with X, then the return always has 1 leading blank.

See Also: Number Format Models in *Oracle Database SQL Language Reference*

Datetime Format Models

You can use datetime format models:

- In the TO_CHAR, TO_DATE, TO_TIMESTAMP, TO_TIMESTAMP_TZ, TO_YMINTERVAL, and TO_DSINTERVAL datetime functions to translate a character string that is in a format other than the default datetime format into a DATETIME value
- In the TO_CHAR function to translate a DATETIME value that is in a format other than the default datetime format into a character string

Datetime Format Elements

A datetime format model is composed of one or more datetime format elements. The following table lists the elements of a date format model.

Table 7–2 Datetime Format Elements

Element	TO_* datetime functions?	TO_CHAR function?	Description
- / , . ; : "text"	Yes		Punctuation and quoted text is reproduced in the result.
AD A.D.	Yes		AD indicator with or without periods.
AM A.M.	Yes		Meridian indicator with or without periods.
BC B.C.	Yes		BC indicator with or without periods.
CC SCC		Yes	Century. ■ If the last 2 digits of a 4-digit year are between 01 and 99 (inclusive), then the century is one greater than the first 2 digits of that year. ■ If the last 2 digits of a 4-digit year are 00, then the century is the same as the first 2 digits of that year. For example, 2002 returns 21; 2000 returns 20.
D	Yes		Day of week (1-7).
DAY	Yes		Name of day, padded with blanks to display width of the widest name of day in the date language used for this element.
DD	Yes		Day of month (1-31).
DDD	Yes		Day of year (1-366).
DL	Yes		Returns a value in the long date format, which is an extension of Oracle Database's DATE format (the current value of the NLS_DATE_FORMAT parameter). Makes the appearance of the date components (day name, month number, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE parameters. For example, in the AMERICAN_AMERICA locale, this is equivalent to specifying the format 'fmDay, Month dd, yyyy'. In the GERMAN_GERMANY locale, it is equivalent to specifying the format 'fmDay, dd. Month yyyy'. Restriction: You can specify this format only with the TS element, separated by white space.
DS	Yes		Returns a value in the short date format. Makes the appearance of the date components (day name, month number, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE parameters. For example, in the AMERICAN_AMERICA locale, this is equivalent to specifying the format 'MM/DD/RRRR'. In the ENGLISH_UNITED_KINGDOM locale, it is equivalent to specifying the format 'DD/MM/RRRR'. Restriction: You can specify this format only with the TS element, separated by white space.
DY	Yes		Abbreviated name of day.
E	Yes		Abbreviated era name (Japanese Imperial, ROC Official, and Thai Buddha calendars).

Table 7–2 (Cont.) Datetime Format Elements

Element	TO_* datetime functions?	TO_CHAR function?	Description
EE	Yes		Full era name (Japanese Imperial, ROC Official, and Thai Buddha calendars).
FF [1..9]	Yes		Fractional seconds; no radix character is printed (use the X format element to add the radix character). Use the numbers 1 to 9 after FF to specify the number of digits in the fractional second portion of the datetime value returned. If you do not specify a digit, then Oracle Database uses the precision specified for the datetime datatype or the datatype's default precision. Examples: 'HH:MI:SS.FF' SELECT TO_CHAR(SYSTIMESTAMP, 'SS.FF3') from dual;
FM	Yes		Returns a value with no leading or trailing blanks. See Also: Additional discussion on this format model modifier in the <i>Oracle Database SQL Language Reference</i>
FX	Yes		Requires exact matching between the character data and the format model. See Also: Additional discussion on this format model modifier in the <i>Oracle Database SQL Language Reference</i>
HH HH12	Yes		Hour of day (1-12).
HH24	Yes		Hour of day (0-23).
IW		Yes	Week of year (1-52 or 1-53) based on the ISO standard.
IYY IY I		Yes	Last 3, 2, or 1 digit(s) of ISO year.
IYYY		Yes	4-digit year based on the ISO standard.
J	Yes		Julian day; the number of days since January 1, 4712 BC. Number specified with J must be integers.
MI	Yes		Minute (0-59).
MM	Yes		Month (01-12; January = 01).
MON	Yes		Abbreviated name of month.
MONTH	Yes		Name of month, padded with blanks to display width of the widest name of month in the date language used for this element.
PM P.M.	Yes		Meridian indicator with or without periods.
Q		Yes	Quarter of year (1, 2, 3, 4; January - March = 1).
RM	Yes		Roman numeral month (I-XII; January = I).
RR	Yes		Lets you store 20th century dates in the 21st century using only two digits. See Also: Additional discussion on RR datetime format element in the <i>Oracle Database SQL Language Reference</i>
RRRR	Yes		Round year. Accepts either 4-digit or 2-digit input. If 2-digit, provides the same return as RR. If you do not want this functionality, then enter the 4-digit year.
SS	Yes		Second (0-59).

Table 7–2 (Cont.) Datetime Format Elements

Element	TO_* datetime functions?	TO_CHAR function?	Description
SSSSS	Yes		Seconds past midnight (0-86399).
TS	Yes		Returns a value in the short time format. Makes the appearance of the time components (hour, minutes, and so forth) depend on the NLS_TERRITORY and NLS_LANGUAGE initialization parameters. Restriction: You can specify this format only with the DL or DS element, separated by white space.
TZD	Yes		Daylight savings information. The TZD value is an abbreviated time zone string with daylight savings information. It must correspond with the region specified in TZR. Example: PST (for US/Pacific standard time); PDT (for US/Pacific daylight time).
TZH	Yes		Time zone hour. (See TZM format element.) Example: 'HH:MI:SS.FFTZH:TZM'.
TZM	Yes		Time zone minute. (See TZH format element.) Example: 'HH:MI:SS.FFTZH:TZM'.
TZR	Yes		Time zone region information. The value must be one of the time zone regions supported in the database. Example: US/Pacific
WW		Yes	Week of year (1-53) where week 1 starts on the first day of the year and continues to the seventh day of the year.
W		Yes	Week of month (1-5) where week 1 starts on the first day of the month and ends on the seventh.
X	Yes		Local radix character. Example: 'HH:MI:SSXFF'.
Y,YYY	Yes		Year with comma in this position.
YEAR SYEAR		Yes	Year, spelled out; S prefixes BC dates with a minus sign (-).
YYYY SYYYY	Yes		4-digit year; S prefixes BC dates with a minus sign.
YYY YY Y	Yes		Last 3, 2, or 1 digit(s) of year.

SQL*Plus Commands

This appendix presents many of the SQL*Plus commands.

This appendix includes the following section:

- [SQL*Plus Commands](#)

SQL*Plus Commands

SQL*Plus is a command-line tool that provides access to the Oracle RDBMS. SQL*Plus enables you to:

- Enter SQL*Plus commands to configure the SQL*Plus environment
- Startup and shutdown an Oracle database
- Connect to an Oracle database
- Enter and execute SQL commands and PL/SQL blocks
- Format and print query results

SQL*Plus is available on several platforms. In addition, it has a web-based user interface, *iSQL*Plus*.

The commands shown in [Table A-1](#) are SQL*Plus commands available in the command-line interface. Not all commands or command parameters are shown.

See Also:

- *SQL*Plus Quick Reference*
- *SQL*Plus User's Guide and Reference*

Table A-1 Basic SQL*Plus Commands

Database Operation	SQL*Plus Command
Log in to SQL*Plus	SQLPLUS [{ username[/password][@connect_identifier] / } [AS { SYSDBA SYSOPER }] /NOLOG]
List help topics available in SQL*Plus	HELP [INDEX topic]
Execute host commands	HOST [command]
Show SQL*Plus system variables or environment settings	SHOW { ALL ERRORS USER system_variable [, system_variable] ... }

Table A-1 (Cont.) Basic SQL*Plus Commands

Database Operation	SQL*Plus Command
Alter SQL*Plus system variables or environment settings	SET <i>system_variable</i> <i>value</i>
Start up a database	STARTUP [PFILE = <i>filename</i>] [MOUNT [<i>dbname</i>] NOMOUNT]
Connect to a database	CONNECT [{username[/password] [@connect_identifier] /} [AS {SYSOPER SYSDBA} {proxy_user [username] [/password] [@connect_identifier]}] Note: Brackets in boldface are part of the syntax and do not imply optionality.
List column definitions for a table, view, or synonym, or specifications for a function or procedure	DESCRIBE [<i>schema.</i>] <i>object</i>
Edit contents of the SQL buffer or a file	EDIT [<i>filename</i> [.ext]]
Get a file and load its contents into the SQL buffer	GET <i>filename</i> [.ext] [LIST NOLLIST]
Save contents of the SQL buffer to a file	SAVE <i>filename</i> [.ext] [CREATE REPLACE APPEND]
List contents of the SQL buffer	LIST [<i>n</i> <i>n m</i> <i>n</i> LAST]
Delete contents of the SQL buffer	DEL [<i>n</i> <i>n m</i> <i>n</i> LAST]
Add new lines following current line in the SQL buffer	INPUT [<i>text</i>]
Append text to end of current line in the SQL buffer	APPEND <i>text</i>
Find and replace first occurrence of a text string in current line of the SQL buffer	CHANGE <i>sepchar</i> <i>old</i> [<i>sepchar</i> [<i>new</i> [<i>sepchar</i>]]] <i>sepchar</i> can be any nonalphanumeric ASCII character such as "/" or "!"
Capture query results in a file and, optionally, send contents of file to default printer	SPOOL [<i>filename</i> [.ext] [CREATE REPLACE APPEND OFF OUT]
Run SQL*Plus statements stored in a file	@ { <i>url</i> <i>filename</i> [.ext] } [<i>arg</i> ...] START { <i>url</i> <i>filename</i> [.ext] } [<i>arg</i> ...] <i>ext</i> can be omitted if the filename extension is .sql
Execute commands stored in the SQL buffer	/
List and execute commands stored in the SQL buffer	RUN

Table A–1 (Cont.) Basic SQL*Plus Commands

Database Operation	SQL*Plus Command
Execute a single PL/SQL statement or run a stored procedure	<code>EXECUTE statement</code>
Disconnect from a database	<code>DISCONNECT</code>
Shut down a database	<code>SHUTDOWN [ABORT IMMEDIATE NORMAL]</code>
Log out of SQL*Plus	<code>{ EXIT QUIT }</code> <code>[SUCCESS FAILURE WARNING]</code> <code>[COMMIT ROLLBACK]</code>
